***TRAFFIC AND CIRCULATION STUDY FOR THE  
GOLETA FIRE STATION 10 PROJECT – CITY OF GOLETA***

Associated Transportation Engineers (ATE) has prepared the following traffic and circulation study for the Goleta Fire Station 10 Project (the "Project"), located in the City of Goleta. It is understood that the results of the study will be incorporated into the EIR being prepared by AMEC.

**PROJECT DESCRIPTION**

The City of Goleta is proposing to construct a new fire station at 7952 Hollister Avenue, located on the northeast corner of the Hollister Avenue/Cathedral Oaks Road intersection. Figure 1 (attached) illustrates the location of the Project site in the western portion of the City. Figure 2 illustrates the Project site plan. The Project includes an 11,600 SF fire station with three apparatus bays, a garage, and staff parking areas. Three firefighters would be on duty at all times, with the 24-hour shift change occurring at 8:00 AM. There would be a short transition between shifts during which six staff members would be on site simultaneously. There would be on average five fire engine response calls during each 24-hour shift, though there is no predictable pattern as to when these emergency responses would occur. Access to the fire station is planned via two driveways on Hollister Avenue.

Fire Station 10 public areas would include the following: an entry lobby; community room/training room with 30-person capacity; and a disabled-accessible public restroom. The community room/training room would be used infrequently for city-related activities and local community non-profit organizational use. The community facilities would be available from 8:00 AM to 9:00 PM

## SETTING

### Street Network

The circulation system serving the Project site is comprised of regional highways, arterial streets, and collector roads (see Figure 1). The following text briefly describes the key roadways in the Project vicinity.

**Hollister Avenue**, located along the southern frontage of the Project site, is a 2- to 4-lane east-west arterial roadway that extends through the Goleta Valley area from State Route 154 on the east to the Bacara Hotel on the west. This roadway serves as the primary east-west surface street route through Goleta. Adjacent to the Project site, Hollister Avenue contains two travel lanes with bike lanes.

**Cathedral Oaks Road**, located west of the Project site, is a 2- to 4-lane arterial roadway that extends north from Hollister Avenue and then proceeds easterly across the Goleta Valley. This roadway provides a secondary east-west surface street route through Goleta. The section of Cathedral Oaks Road in the study area contains two travel lanes with bike lanes.

### Roadway Operations

Figure 3 shows the Existing average daily traffic (ADT) volumes for the study-area roadway segments. Existing roadway volumes were obtained from count data collected by the City of Goleta and new counts conducted in November of 2017 (count data attached for reference). The operational characteristics of the study-area roadways were analyzed based on the City of Goleta's "Acceptable Capacity" rating system (summary of roadway capacities attached for reference). Table 1 shows the Existing ADT volumes and the City's Acceptable Capacity thresholds for study-area roadways.

**Table 1**  
**Existing Roadway Operations**

Roadway Segment	Roadway Classification	Geometry	Acceptable Capacity	Existing ADT
Hollister Avenue e/o Cathedral Oaks Road	Major Arterial	2 Lanes	14,300	6,200
Cathedral Oaks Road n/o Calle Real	Major Arterial	2 Lanes	14,300	3,200

The data presented in Table 1 show that the study-area roadways operate within their acceptable capacities with Existing traffic volumes.

### Intersection Operations

Because traffic flow on urban arterials is most constrained at intersections, detailed traffic flow analyses focus on the operating conditions of critical intersections during peak travel periods. In rating intersection operations, A Levels of Service (LOS) A through F are used, with LOS A indicating free flow operations and LOS F indicating congested operations (more complete definitions of levels of service are attached). The City of Goleta has established LOS C as the minimum acceptable operating standard for intersections.

Existing AM and PM peak hour traffic volumes for the study-area intersections were obtained from traffic counts conducted in November of 2017 (traffic count data attached). The Existing peak hour traffic volumes are shown on Figure 3 and Figure 4 illustrates the existing intersection lane geometries and traffic controls.

Levels of service for the stop-sign controlled intersections were calculated using the Highway Capacity Manual (HCM)<sup>1</sup> methodology pursuant to City and Caltrans standards. (calculation worksheets are attached). The HCM methodology determines levels of service based on the average stopped delay per vehicle at the intersection. Table 1 lists the existing levels of service for the study-area intersections

**Table 2**  
**Existing Intersection Levels of Service**

Intersection	Control	AM Peak Hour		PM Peak Hour	
		Delay	LOS	Delay	LOS
US 101 NB Ramp-Calle Real/Winchester Canyon Rd	All-Way Stop	8.5 Sec.	A	10.0 Sec.	A
Calle Real/Cathedral Oaks Road	All-Way Stop	13.6 Sec.	B	11.5 Sec.	B
U.S. 101 SB Ramps/Cathedral Oaks Road	Two-Way Stop	9.7 Sec.	A	10.2 Sec.	B
Hollister Avenue/Cathedral Oaks Road	All-Way Stop	11.3 Sec.	B	11.7 Sec.	B

The data presented in Table 2 show that the study-area intersections currently operate acceptably in the LOS A-B range.

### IMPACT THRESHOLDS

The City of Goleta traffic impact thresholds were used to determine impacts related to the Project. The City's thresholds are outlined in the following text.

<sup>1</sup> Highway Capacity Manual, Transportation Research Board, National Research Council, 2010.

### City of Goleta Impact Threshold of Significance

- A. The addition of project to an intersection increases the volume to capacity (V/C) ratio by the value provided below or sends at least 5, 10 or 15 trips to an intersection operating at LOS F, E, or D.

<b>Significant Changes in Levels of Service</b>	
<b>Intersection Level of Service (Including Project)</b>	<b>Increase in V/C or Trips Greater Than</b>
LOS A	0.20
LOS B	0.15
LOS C	0.10
LOS D	15 Trips
LOS E	10 Trips
LOS F	5 Trips

- B. The project's access to a major road or arterial road would require access that would create an unsafe situation, a new traffic signal, or major revisions to an existing traffic signal.
- C. Project adds traffic to a roadway that has design features (e.g.; narrow width, road side ditches, sharp curves, poor sight distance, inadequate pavement structure) or receives use which would be incompatible with substantial increases in traffic (e.g. rural roads with use by farm equipment, livestock, horseback riding, or residential roads with heavy pedestrian or recreational use, etc.) that will become potential safety problems with the addition of project or cumulative traffic. Exceedance of the roadways designated Circulation Element Capacity may indicate the potential for the occurrence of the above impacts.
- D. Project traffic would utilize a substantial portion of an intersection(s) capacity where the intersection is currently operating at acceptable levels of service (A-C) but with cumulative traffic would degrade to or approach LOS D (V/C 0.81). Substantial is defined as a minimum change of 0.03 for intersections which would operate from 0.80 to 0.85 and a change of 0.02 for intersections which would operate from 0.86 to 0.90, and 0.01 for intersections operating at anything lower.

The City of Goleta's roadway impact threshold defines a significant roadway impact if a project would increase traffic volumes by more than 1.0 percent (either project-specific or project contribution to cumulative impacts) on a roadway that currently exceeds its Acceptable Capacity or is forecast to exceed its Acceptable Capacity under cumulative conditions.

If the above thresholds are exceeded, construction of improvements or project modifications to reduce the levels of significance to insignificance are required.

## PROJECT-SPECIFIC ANALYSIS

### Trip Generation

Trip generation estimates were developed for the Project based on operational information provided by staff at the Santa Barbara County Fire Department since there are no published trip generation studies for fire stations. The key assumptions used for the trip generation analysis are as follows:

- 3 staff arrive and 3 staff depart during the AM peak hour;
- 5 fire engine calls per day;
- 3 miscellaneous trips per day (visitors, deliveries, errands, etc.);
- Public meeting room used 13 times per peak month (2-7 cars per meeting).

Table 2 summarizes the trip generation estimates developed for the Project.

**Table 2**  
**Project Trip Generation**

<b>Project Component</b>	<b>Unit</b>	<b>ADT</b>	<b>AM Peak Hour Trips</b>	<b>PM Peak Hour Trips</b>
Staff Trips	3 Staff	6	6	0
Fire Engine Calls	5 Calls	10	1	1
Misc. Trips	3 Trips	6	0	0
Public Meeting Room	13/month	<u>7</u>	<u>0</u>	<u>1</u>
<b>Total</b>		<b>29</b>	<b>7</b>	<b>2</b>

As shown in Table 2, the Project is forecast to generate 29 ADT, with 7 trips during the AM peak hour period and 2 trips during the PM peak hour period.

### Project Trip Distribution

Table 3 and Figure 5 show the trip distribution pattern for the Project which was developed based on existing traffic patterns and the anticipated service area for the new fire station. Figure 5 also shows the project-added trips at the study-area roadways and intersections.

**Table 3  
Project Trip Distribution Percentages**

<b>Origin/Destination</b>	<b>Direction</b>	<b>Distribution %</b>
U.S. 101	East	45%
	West	10%
Hollister Avenue	East	30%
Cathedral Oaks Road	North	15%
<b>Total:</b>		<b>100%</b>

### Roadway Operations

Table 4 presents the Existing and Existing + Project volumes and Acceptable Capacities for the study-area roadways.

**Table 4  
Existing & Existing + Project Roadway Operations**

<b>Roadway Segment</b>	<b>Average Daily Trips</b>				<b>Project Impact?</b>
	<b>Acceptable Capacity</b>	<b>Existing ADT</b>	<b>Project Added ADT</b>	<b>Existing+Project ADT</b>	
Hollister Avenue e/o Cathedral Oaks Road	14,300	6,200	+20	6,220	No
Cathedral Oaks Road n/o Calle Real	14,300	3,200	+4	3,204	No

The data presented in Table 4 show that the study-area roadways would continue to operate within their Acceptable Capacities with the addition of Project traffic.

### Intersection Operations

Existing + Project peak hour traffic volumes for the study-area intersections are shown on Figure 6. Tables 5 and 6 present the Existing levels of service, show the project-added traffic volumes, and identify potentially significant impacts based on the City's thresholds.

**Table 5**  
**Existing Intersection Operations and Project-Added Traffic – AM Peak Hour**

Intersection	Existing		Project Added	
	Delay	LOS	Trips	Impact ?
Calle Real/Winchester Canyon Road	8.5 Sec	A	1	No
Calle Real/Cathedral Oaks Road	13.6 Sec	B	3	No
U.S. 101 SB Ramps/Cathedral Oaks Road	9.7 Sec	A	5	No
Hollister Avenue/Cathedral Oaks Road	11.3 Sec	B	5	No

**Table 6**  
**Existing Intersection Operations and Project-Added Traffic – PM Peak Hour**

Intersection	Existing		Project Added	
	V/C	LOS	Trips	Impact ?
Calle Real – U.S. 101 NB Ramps/Winchester Canyon Road	10.0 Sec	B	0	No
Calle Real/Cathedral Oaks Road	11.5 Sec	B	0	No
U.S. 101 SB Ramps/Cathedral Oaks Road	10.2 Sec	B	2	No
Hollister Avenue/Cathedral Oaks Road	11.7 Sec	B	2	No

The data presented in Tables 5 and 6 show that the Project would add a maximum of 5 trips during the AM peak hour and 2 trips during the PM peak hour to the study-area intersections, which would operate acceptably at LOS B or better. The Project would not generate significant impacts based on City of Goleta thresholds.

## **SITE ACCESS AND PARKING**

### **Site Distance Analysis**

As shown on Figure 2 (Project Site Plan), access for the fire station is proposed via two driveways on Hollister Avenue. A sight distance evaluation was completed for the proposed driveways to determine if adequate sight distances are provided, as reviewed below.

Sight Distance Criteria. The driver of a vehicle departing the Project driveways should have an unobstructed view along Hollister Avenue sufficient in length to anticipate and avoid potential collisions. The stopping sight distance standards in the Caltrans Highway Design Manual<sup>2</sup> were used to determine minimum sight distance requirements for the fire station

<sup>2</sup>Highway Design Manual, California Department of Transportation, Sixth Edition, 2006.

driveways. Given that the adjacent intersection of Hollister Avenue and Cathedral Oaks Road is controlled by all-way stop signs, a 25 MPH design speed was used as the sight distance standard for vehicles looking to the west. The Caltrans stopping sight distance standard for 25 MPH is 150 feet. The speed limit on Hollister Avenue east of the site is 45 MPH. The sight distance requirement for 45 MPH is 360 feet.

Western Apparatus Bay Driveway. The sight distance looking west from the apparatus bay driveway extends past the Hollister Avenue/Cathedral Oaks Road intersection which is 195 feet away, and thus exceeds the 150-foot minimum stopping sight distance requirement. Hollister Avenue has both horizontal and vertical curves east of the Project site. The sight distance looking to the east from the apparatus bay driveway was measured at 495 feet, which exceeds the minimum stopping sight distance requirement of 360 feet. Figure 7 illustrates the sight distances looking to the west and east from the apparatus bay driveway.

Eastern Public Driveway. The sight distance looking west from the public driveway extends past the Hollister Avenue/Cathedral Oaks Road intersection which is 375 feet away, and thus exceeds the 150-foot minimum stopping sight distance requirement. Hollister Avenue has both a horizontal and vertical curve east of the Project site. The sight distance looking to the east from the public driveway was measured at 530 feet, which exceeds the minimum stopping sight distance requirement of 360 feet. Figure 8 illustrates the sight distances looking to the west and east from the public driveway.

### **Pedestrian/Bicycle Improvements**

The Project frontage on Hollister Avenue is currently unimproved with no sidewalks provided. Hollister Avenue also narrows at the Project site and the westbound Class II bike lane becomes discontinuous. The Project would implement frontage improvements including a new sidewalk that would extend from the existing sidewalk located east of the site to Cathedral Oaks Road bridge at the railroad and US 101. The

current site design has the sidewalk extending around the curb return and ending behind the existing barricade wall adjacent to the railroad bridge, leaving no way for pedestrians to safely connect to the street or the intersection. The design will need to be modified to allow pedestrians to safely access the corner of the Hollister Avenue/Cathedral Oaks Road intersection. The frontage improvements should also be designed accommodate the transition of the westbound Class II bike which is currently discontinuous adjacent to the site.

## Parking

The Project is proposing to provide nine parking spaces for the Fire Station employees at the rear of site, and seven public parking spaces located adjacent to Hollister Avenue.

The Project includes a community room/training room with 30-person capacity which would be for County of Santa Barbara Fire Department training use and City of Goleta-related public activities use. The Santa Barbara County Fire Department anticipates the following intensity of the community room/training room use:

**Fire Department meetings and training** would occur between 9:00 AM and 5:00 PM weekdays; a weekly on-site staff meeting would occur, and up to four training sessions/month involving crew from other stations (travelling in a fire engine or two cars). All vehicles would be accommodated by crew parking spaces and fire engine areas.

**City of Goleta and public meetings and training** would occur between 8:00 AM and 9:00 PM weekdays and 8:00 AM to 5:00 PM on Saturdays. This would include City staff meetings on weekdays up to once/month, and restricted public use such as limited enrollment (small class) First Aid/CPR classes and Community Emergency Response Team (CERT) training. The small public meetings would occur up to once/week on weekdays between 8:00 AM and 5:00 PM, and an annual CERT training extending once/week over 8 weeks that would occur from 6:00-9:00 PM on a weeknight. Weekend training could occur up to six Saturdays/year. City of Goleta staff and public meeting attendees would carpool such that total attendance would not exceed the seven available public parking spaces.

## CUMULATIVE ANALYSIS

Cumulative traffic volumes were forecast for the study-area roadways and intersections assuming development of the approved and pending projects located within the study area. The list of approved and pending projects used for the cumulative analysis (November 2017) is attached for reference. Trip generation estimates were developed for the cumulative projects using the rates presented in the Institute of Transportation Engineers (ITE) Trip Generation report<sup>3</sup> (cumulative trip generation calculation worksheet attached). The traffic generated by the cumulative projects was added to the existing volumes based on the distribution percentages presented in existing traffic studies and environmental documents completed for developments in the study area. Figure 9 presents the Cumulative traffic volumes for the study-area roadways and intersections.

---

<sup>3</sup> Trip Generation, Institute of Transportation Engineers, 9th Edition, 2012.

### Cumulative Roadway Operations

Figure 10 presents the Cumulative + Project volumes forecasts. Table 7 compares the Cumulative and Cumulative + Project roadway operations and identifies cumulative impacts based on City of Goleta impact thresholds.

**Table 7**  
**Cumulative + Project Roadway Operations**

Roadway Segment	Average Daily Trips				
	Acceptable Capacity	Cumulative	Project Added	Cumulative+Project	Project Impact
Hollister Avenue e/o Cathedral Oaks Road	14,300	6,210	+20	6,230	No
Cathedral Oaks Road n/o Calle Real	14,300	3,257	+4	3,261	No

As shown in Table 7, the study-area roadways are forecast to carry volumes within their Acceptable Capacity ratings under Cumulative + Project traffic conditions. The Project would therefore not contribute to significant cumulative impacts based on City of Goleta impact thresholds.

### Intersection Impacts

Tables 8 and 9 compare the Cumulative and Cumulative + Project levels of service and identify cumulative impacts based on City of Goleta thresholds.

**Table 8**  
**Cumulative + Project Intersection Operations – AM Peak Hour**

Intersection	Cumulative		Project-Added Trips	Impact?
	LOS	V/C		
Calle Real – U.S. 101 NB Ramps/ Winchester Canyon Road	8.5	A	1	No
Calle Real/Cathedral Oaks Road	13.7	B	3	No
U.S. 101 SB Ramps/Cathedral Oaks Road	9.8	A	5	No
Hollister Avenue/Cathedral Oaks Road	11.3	B	5	No

**Table 9**  
**Cumulative + Project Intersection Operations – PM Peak Hour**

Intersection	Cumulative		Project-Added Trips	Impact?
	LOS	V/C		
Calle Real – U.S. 101 NB Ramps/ Winchester Canyon Road	10.1	B	0	No
Calle Real/Cathedral Oaks Road	11.5	B	0	No
U.S. 101 SB Ramps/Cathedral Oaks Road	10.2	B	2	No
Hollister Avenue/Cathedral Oaks Road	11.7	B	2	No

The data presented in Tables 8 and 9 show that the Project would add a maximum of 5 trips during the AM peak hour and 2 trips during the PM peak hour to the study-area intersections which would operate acceptably at LOS B or better with Cumulative volumes. The Project would not generate significant cumulative impacts based on City of Goleta thresholds.

### CONGESTION MANAGEMENT PROGRAM ANALYSIS

The Santa Barbara County Association of Governments (SBCAG) has developed a set of traffic impact thresholds to assess the impacts of land use decisions made by local jurisdictions on regional transportation facilities located within the Congestion Management Program (CMP) roadway system. According to the CMP Land Use Analysis Program, projects that generate less than 500 ADT and less than 50 peak hour trips are considered to be consistent with the CMP. The Goleta Fire Station 10 Project would generate 29 ADT, 7 AM peak hour trips and 2 PM peak hour trips. The Project would not impact the CMP facilities in the area.

This concludes our traffic impact analysis for the Goleta Fire Station 10 Project.

**Table 1  
Goleta Roadway Classifications**

Classification	Purpose and Design Factors	Design Capacity		LOS C Threshold <sup>1</sup>	
		2 Lane	4 Lane	2 Lane	4 Lane
Primary 1	Roadways designed to serve primarily non-residential development. Roadways would have a minimum of 12-foot wide lanes with shoulders and few curb cuts. Signals would be spaced at 1 mile or more intervals.	19,900	47,760	15,900	38,200
Primary 2	Roadways which serve a high proportion of non-residential development with some residential lots and few or no driveway curb cuts. Lane widths are a minimum of 12 feet with well spaced curb cuts. Signals intervals at a minimum of 1/2 mile.	17,900	42,480	14,300	34,000
Primary 3	Roadways designed to serve non-residential development and residential development. More frequent driveways are acceptable. Potential signal intervals of 1/2-1/4 mile.	15,700	37,680	12,500	30,100
Secondary 1	Roadways designed to primarily serve non-residential development and large lot residential development with well spaced driveways. Roadways would be 2 lanes with infrequent driveways. Signal would generally occur at intersections with primary roads.	11,600	NA	9,300	NA
Secondary 2	Roadways designed to serve residential and non-residential land uses. Roadways would be 2 lanes with close to moderately spaced driveways.	9,100	NA	7,300	NA
Secondary 3	Roadways designed to primarily serve residential with small to medium lots. Roadways are 2 lanes with more frequent driveways.	7,900	NA	6,300	NA

<sup>1</sup> Defined as 80% of Design Capacity.

Source: Santa Barbara County Public Works, Transportation Division.

### Signalized Intersection Level of Service Definitions

LOS	Delay (a)	V/C Ratio	Definition
A	< 10.0	< 0.60	Progression is extremely favorable. Most vehicles arrive during the green phase. Many vehicles do not stop at all.
B	10.1 - 20.0	0.61 - 0.70	Good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20.1 - 35.0	0.71 - 0.80	Only fair progression, longer cycle lengths, or both, result in higher cycle lengths. Cycle lengths may fail to serve queued vehicles, and overflow occurs. Number of vehicles stopped is significant, though many still pass through intersection without stopping.
D	35.1 - 55.0	0.81 - 0.90	Congestion becomes more noticeable. Unfavorable progression, long cycle lengths and high v/c ratios result in longer delays. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55.1 - 80.0	0.91 - 1.00	High delay values indicate poor progression, long cycle lengths and high v/c ratios. Individual cycle failures are frequent
F	> 80.0	> 1.00	Considered unacceptable for most drivers, this level occurs when arrival flow rates exceed the capacity of lane groups, resulting in many individual cycle failures. Poor progression and long cycle lengths may also contribute to high delay levels.

(a) Average control delay per vehicle in seconds.

### Unsignalized Intersection Level of Service Definitions

The HCM<sup>1</sup> uses *control delay* to determine the level of service at unsignalized intersections. Control delay is the difference between the travel time actually experienced at the control device and the travel time that would occur in the absence of the traffic control device. Control delay includes deceleration from free flow speed, queue move-up time, stopped delay and acceleration back to free flow speed.

LOS	Control Delay Seconds per Vehicle
A	< 10.0
B	10.1 - 15.0
C	15.1 - 25.0
D	25.1 - 35.0
E	35.1 - 50.0
F	> 50.0
